SUMMARY

Junior cybersecurity candidate focused on SOC triage, access review, and risk writing. Completed Foundations of Cybersecurity (Google on Coursera, September 30, 2026). Hands-on practice in Linux hardening and log analysis, SQL auditing, and Python automation. Studying for the CISSP. Portfolio includes the eight domains, CIA, PII/SPII, OWASP, a scoped team audit, a permission audit, an unknown-device investigation, and a mini risk register.

SKILLS

- Security: CIA, eight CISSP domains (studying), PII/SPII, OWASP classes, audit scope, control categories, alert triage, least privilege
- Systems: Linux user and group review, sudo and file permissions, service-account hygiene, log analysis
- Data: SQL querying and audit-style lookups; Python scripts for log parsing and repeatable checks
- Working style: fact versus inference, named owner on every recommendation, plain-language write-ups

SELECTED PORTFOLIO WORK

Linux permission and privilege audit

Inventoried users, groups, sudo paths, world-writable files, and unexpected SUID binaries on a shared host. Produced a findings list with risk and a least-privilege recommendation for each.

Unknown device investigation

SOC-style triage of an unrecognized asset: scope, identifiers, inventory comparison, and a monitor / isolate / escalate decision with the evidence separated from the guess.

PII and SPII handling one-pager

Staff-facing guide defining PII versus more sensitive SPII, approved handling, and the first actions if data leaves the approved store.

Mini risk register

Five owned risks — credential phishing, standing admin, unlisted devices, broad SPII access, and no incident owner — with likelihood, impact, and a treatment.

EDUCATION AND CREDENTIALS

Foundations of Cybersecurity — Google / Coursera · Sep 30, 2026

Course certificate. Verify ID 22W5X58597QD. Full professional certificate still in progress.

CISSP — In progress

Current study focus: access control, security operations, and risk governance.
